

EDUCATION

EPFL, Msc in Computer Science (Grade: 5.76/6.0, Excellence Fellowship recipient)	09/2023 - 01/2026
EPFL, Bsc in Computer Science (Grade: 5.68/6.0)	09/2020 - 06/2023
Imperial College London, Exchange year, Bsc in Computing	10/2022 - 06/2023

PROFESSIONAL EXPERIENCE

Research assistant, EPFL (CHANGE lab)	02/2025 - 07/2025
Continuation of my semester project, on the hybrid modelling of stomatal resistance and evapotranspiration.	
Intern in algorithmic geometry, INRIA Sophia-Antipolis, TITANE team	07/2024 - 09/2024
Explored methods to infer the geometry of galaxy mega-structures from simulated observations.	
Student assistant, EPFL	02/2022 - 06/2022
Content reviews, Q&A sessions, and homework corrections for the course AICC II (information theory).	
Civil servant, Longo Mai	02/2026 - 08/2026
Organic farm with very diverse activities including vegetable farming, sheep caring, metal working/welding, etc.	

OTHER EXPERIENCE

IT Manager, Unipoly association	2024-2025
Responsible for the IT infrastructure of this association promoting ecology at EPFL and Unil.	
Comitee, gnugen	2023-2024
In the committee of this association promoting free software at EPFL	

PROJECTS

Continuous Service on Intermittent Peers For my Master Project supervised by the [DEDIS](#) team, I proposed and implemented a set of protocols inspired by the [SolarProtocol](#), that lets decentralized servers powered only by intermittent energy (e.g. solar), and hence who turn off and on regularly, collectively offer a continuous service. The project was an original proposition and obtained the grade 6.0/6.0 ([link to thesis](#)).

ML downsampling for retinal implants Computer vision project, in which we aimed to train a downsampler to make it easier for blind patients using retinal implants of very low resolution to recognize objects.

Hybrid modelling of stomatal resistance Project with the [CHANGE](#) team (hydrology), in which I developed a hybrid module predicting stomatal resistance, which combines physical laws with machine learning models, and improves the evapotranspiration predictions of the climate model T&C.

Spectral path tracer Project for the course "Advanced Computer Graphics", in which I extended a path-tracing renderer so that it performs spectral rendering, and models precisely the iridescence phenomenon. I was awarded the first place during the contest organized by the course among 50 other students, and the result is visible [here](#).

Other academic projects 2nd Semester Project aiming to model deep tonal music theory concepts in python, AI Safety bachelor project ("Mitigating AI Deception", with publication [here](#)), Machine Learning project reproducing the McGurk effect on audiovisual language models, Generative Diffusion project where we used image models to generate animated, evolving multi-prompt videos

Interactive Map Development of an interactive map of places committed to a solidary ecology in Lausanne, designed to be cooperative. It is visible at [carte.unipoly.ch](#).

SKILLS

Natural languages	French (native), English (C2), German (B1), Esperanto (notions)
Computer languages	Python, C, C++, Java (mastered); Rust, Go, C#, Scala, VHDL, Assembly, HTML, Javascript (good level)
Technical skills	Git, GNU/Linux, Bash, SQL, Python ML libraries (torch etc.), Unity+Godot
